```

Bayesian learning 2/20

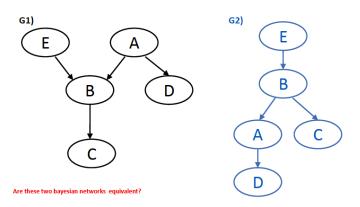

### Outline

This lecture introduces the concept of learning in probabilistic graphical models. The objective is to discuss the following topics:

- Learning in Bayesian Networks
- Maximum likelihood
- Expectation-Maximization algorithm

Bayesian learning 3/20

## Question

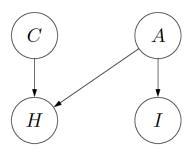

$$P(A, E, B, C, D) = P(A)P(E)P(B | A, E)P(C | B)P(D | A)$$
  
 $P(A, E, B, C, D) = P(E)P(B | E)P(A | B)P(C | B)P(D | A)$ 

Bayesian learning 4/20

#### Review

#### So far, we have studied:

- Concept of Bayesian network
- Conditional independence
- Inference in Bayesian networks
- Dynamic Bayesian networks

Bayesian learning 5/20

# Why learning?

### Knowledge acquisition bottleneck

- Knowledge acquisition is an expensive process
- Often we don't have an expert

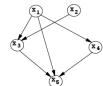

### Data is cheap

- Amount of available information growing rapidly
- Learning allows us to construct models from raw data

6/20

### Problem formulation

- Given:
  - A Bayesian network structure.

■ A data set

| $X_1$ | $X_2$ | <i>X</i> <sub>3</sub> | <i>X</i> <sub>4</sub> | <i>X</i> <sub>5</sub> |
|-------|-------|-----------------------|-----------------------|-----------------------|
| 0     | 0     | 1                     | 1                     | 0                     |
| 1     | 0     | 0                     | 1                     | 0                     |
| 0     | 1     | 0                     | 0                     | 1                     |
| 0     | 0     | 1                     | 1                     | 1                     |
| :     | :     | :                     | :                     | :                     |

■ Estimate conditional probabilities:

$$P(X_1), P(X_2), P(X_3|X_1, X_2), P(X_4|X_1), P(X_5|X_1, X_3, X_4)$$

Bayesian learning 7/20

# Example: one variable

Setting: Rating of a movie  $\{1, 2, 3, 4, 5\}$ 

Parameters: 
$$\theta = (P(1), P(2), P(3), P(4), P(5))$$

Training data: 
$$D_{train} = \{1, 3, 4, 4, 4, 4, 4, 5, 5, 5\}$$

[Liang 2014]

Bayesian learning 8/20

# Example: one variable

We want to find  $\theta$  using  $D_{train}$  but ...

... P(R) is proportional to number of occurrences of R in  $D_{train}$ 

$$\textit{D}_{\textit{train}} = \{1, 3, 4, 4, 4, 4, 4, 5, 5, 5\}$$

|     | R                     | P(R) |  |
|-----|-----------------------|------|--|
|     | 1                     | ?    |  |
| ) . | 2                     | ?    |  |
| ٠.  | 3                     | ?    |  |
|     | 1<br>2<br>3<br>4<br>5 | ?    |  |
|     | 5                     | ?    |  |

Bayesian learning 9/20

# Example: one variable

We want to find  $\theta$  using  $D_{train}$  but ...

... P(R) is proportional to number of occurrences of R in  $D_{train}$ 

$$\textit{D}_{\textit{train}} = \{1, 3, 4, 4, 4, 4, 4, 5, 5, 5\}$$

|    | R | P(R) |
|----|---|------|
|    | 1 | 0.1  |
| θ: | 2 | 0    |
|    | 3 | 0.1  |
|    | 4 | 0.5  |
|    | 5 | 0.3  |

Bayesian learning 10/20

## Example: two variables

Setting: Rating of a movie  $\{1, 2, 3, 4, 5\}$  and Genre of a movie  $\{drama, comedy\}$ 

Parameters: P(G,R) = P(G)P(R|G)

Training data: 
$$D_{train} = \{(d,4), (d,4), (d,5), (c,1), (c,5)\}$$

Bayesian learning 11/20

## Example: two variables

We want to find  $\theta$  using  $D_{train}$  but ...

... P(G), P(R|G) are proportional to number of occurrences of R, G in  $D_{train}$ 

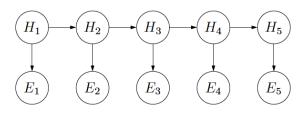

$$D_{train} = \{(d,4), (d,4), (d,5), (c,1), (c,5)\}$$

|            |   |      | G | R | P(R G) |
|------------|---|------|---|---|--------|
|            | G | P(G) | d | 4 | 2/3    |
| $\theta$ : | d | 3/5  | d | 5 | 1/3    |
|            | С | 2/5  | С | 1 | 1/2    |
|            |   |      | С | 5 | 1/2    |

Bayesian learning 12/20

### Example: HMM

Setting:  $H_1, \ldots, H_n$  are the Hidden variables and  $E_1, \ldots, E_n$  are the observations

$$P(H,E) = \prod_{i=1}^{n} P_{trans}(H_i|H_{i-1})P_{emi}(E_i|H_i)$$

Parameters:  $\theta = \{P_{trans}, P_{emi}\}$ 

Bayesian learning 13/20

### Maximum likelihood

#### Maximum likelihood objective:

$$\max_{\theta} \prod_{x_i \in D_{train}} P(X = x_i | \theta)$$

Example:  $D_{train} = \{(d, 4), (d, 5), (c, 5)\}$ 

$$p(X = x|\theta) = P(G = d)P(R = 4|d)P(G = d)P(R = 5|d)P(G = c)P(R = 5|c)$$

Solution: take logs and solve for the best  $\theta = \theta^*$ 

Question: what if we don't have data for all events?

Bayesian learning 14/20

# Maximum likelihood vs Bayesian learning

#### Maximum likelihood

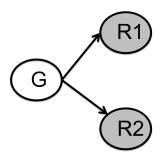

- $\bullet$  Assumes that  $\theta$  is unknown but fixed parameter
- Finds  $\theta^*$ , the value that maximizes the likelihood

### Bayesian learning

- ullet Treats heta as a random variable
- Assumes a prior probability of  $\theta : p(\theta)$
- Tries to compute the posterior probability of  $\theta$  :  $p(\theta|D)$

Bayesian learning 15/20

# Expectation-Maximization (EM)

What if we don't observe some of the variables?

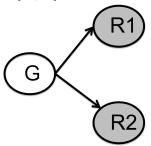

Example: 
$$D_{train} = \{(?, 4, 5), (?, 4, 4), (?, 5, 3), (?, 1, 2), (?, 5, 4)\}$$

Bayesian learning 16/20

# Expectation-Maximization (EM)

Variables: *H* is hidden, *E* is observed (to be *e*)

Example:  $H = \{G\}, E = \{R_1, R_2\}$ 

### Maximum likelihood objective:

$$\max_{\theta} \prod_{e \in D_{train}} P(E = e | \theta)$$

$$= \max_{\theta} \prod_{e \in D_{train}} \sum_{h} P(E = e, H = h | \theta)$$

Bayesian learning 17/20

# Expectation-Maximization (EM)

### Algorithm: Expectation Maximization

### E-step:

Compute  $q(h) = P(H = h|E = e, \theta)$  for each h

Create weighted points: (h, e) with weight q(h)

### M-step:

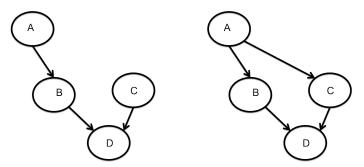

Compute maximum likelihood (just count and normalise) to get  $\boldsymbol{\theta}$ 

Repeat until convergence.

Bayesian learning 18/20

#### Model selection

Given a new dataset  $\{A, B, C, D\}$ , we can evaluate the probability of each model structure (using the parameters we learned by maximum likelihood) and pick the model with the highest P(A, B, C, D|parameters).
